Abstract

In the 1950s, the American public became aware that certain threats to human health and the environment. In response to this threat, new regulations regarding chemical manufacture, use, and disposal were developed under federal law. Today, the public has a much better understanding of the problem and generally supports management efforts. The 1990s we face with another serious environmental threat: The invasion of our land by aggressive nonnative plants. While farmers have always fought weeds in crops, invasion of these and other formerly weed-free lands has increased in recent decades. Because they often look no different than native plants, nonnative plants can become established and cause serious economic damage before they are detected. Since the 1960s, the United States has made strides in most areas of environmental protection. However, despite our best efforts, invasions, which in part created the need for pesticides, continue to occur. Efforts to exclude foreign pests from other countries. In recent years, this has alarmed scientists worldwide and prompted federal officials to work together to address the problem. Environmentally sound management techniques for weed prevention and early control are necessary to win the battle against invasive plants.
