### Abstract

The growth of government budgets can be broken down into a-institutional and institutional components. The former component is the familiar substitution, income, and population/public goods-tax sharing effects is estimated to contribute about two-fifths of the growth of U.S. government spending. The latter component is rent-seeking political redistributions, bureaucracy and perceptual/informational impediments is important, too, but an exact imputation cannot be asserted given the state of the art in empirical public choice theory. The cross-effects on spending of the growth of regulation and tax preferences or tax expenditures, though interesting, is not pursued.

I wish to express my appreciation to the Hoover Institution, The Claremont Center for Economic Policy Studies, Simon Fraser University's Programme of Distinction and the Nobel Institute for assistance on this paper. Special thanks to Lori Harnack of Claremont for typing assistance. Members of the Claremont Colleges Workshop in Economics and the Nobel Symposium on Growth of Government gave me many useful comments. Keith Acheson and Ross Eckert made detailed criticisms and suggestions on the previous draft which I have not always heeded. I am also indebted to a thoughtful referee and co-editor Angmar Sandmo. Douglas Wills, my student at SFU and now of the Fraser Institute in Vancouver, provided able research assistance.
