Abstract

The importance of the development of transpersonal psychology as a science is considered. Arguments from romanticism, scientism, and constructionism that challenge this possibility are countered. A distinction is drawn between the field of transpersonal psychology as a science and the broader area known as transpersonal studies that may legitimately use scientific or nonscientific methods. The concepts of transpersonal phenomena and transcendent noumena are delineated, the latter being seen as outside of the purview of science. The benefits of embracing a scientific approach are contrasted to a number of epistemological alternatives. The scientific approach is forwarded for its potential contribution towards providing a unifying paradigm for the discipline of psychology and for solving crucial problems in the world. I hope that this presentation challenges the reader to more deeply examine the role of science in transpersonal psychology.
