#### Abstract

A single dose (10<sup>−14</sup> mg/100 g body wt.) of the carcinogenic nitrosamide *N*-methyl-*N*-nitrosourea (NMU) temporarily reduced the white blood cell count and severely damaged lymphoid cell populations in the spleen, thymus, liver and kidneys of *Xenopus laevis*. Lymphoid tissue regeneration occurred in the liver, kidneys and spleen lymphoid follicles, but the small lymphocytic cortex of the thymus glands and the thymus-dependent halos of small lymphocytes normally found surrounding spleen lymphoid follicles were not restored. Skin allografts survived in NMU-treated *Xenopus* for 250 to 450 days or more, eventually being replaced by a slow process which involved lymphocytic infiltration, but which may not represent an allograft immune response.
