Abstract

There is, in the folklore of computer science, a strong suggestion that programs and the processes of programming can be beautiful. Surprisingly, these same issues of programming aesthetics have not been a focus of empirical research, to date. The purpose of the present work is to begin to address programming aesthetics from a "non-folklore" perspective. Related literature is reviewed and an exploratory empirical study of programming aesthetics is described. The results of this study suggest that patterns of programming aesthetics share common features with patterns of aesthetics in other domains. In particular, programs which are familiar, highly structured, and contain suggestions of hidden information tend to be aesthetically pleasing. Novelty also appears to enhance the aesthetic character of programs.
