Veterinary clinical pathology.

Author(s) : [Coles, E. H.](#)

Author Affiliation : Coll. Vet. Med., State Univ., Manhattan, Kansas, USA.

Book : [Veterinary clinical pathology](#). 1980 No.3rd edition pp.xii + 562pp. ref.man

Abstract : Although the author claims that this book "is designed primarily for veterinary students and practising veterinarians and is not meant to be an exhaustive review", it should have a distribution far wider than this implies. For the practitioner who has, or wants, a laboratory, the book is about as perfect as possible. If practitioners who do not have their own laboratory but use other laboratories would read this book, they would help both themselves and the receiving laboratories. In the libraries of Veterinary Investigation and similar laboratories, it would be a valuable asset for laboratory and professional staff. Students should have access to it, though they should

to buy it. The layout is conventional - according to body systems, and includes sections on microbiology and parasitology. Most experienced laboratory workers would find the methods of egg-counting. The author has hit a fair balance between the elementary and the sophisticated. Excellent photographs, particularly the colour plate of colour characteristics of different bacteria, and overall production by the publisher: a very good book.

ADDITIONAL ABSTRACT:

This edition, as in previous editions [see Hm/A 45 4915] is designed primarily for use by students and veterinarians and is not meant to be an exhaustive literature review. Chapter 510) on "Examinations for parasites" has been revised by S. A. Ewing. This covers the examination of faeces, urine and blood. Tables and photomicrographs are provided for the identification of helminths and protozoa of cattle, sheep, goats, horses and cats. There is a short section on the diagnosis of bovine genital trichomoniasis. There are over 90 references.
