It is possible for a language to emerge with no direct linguistic history or outside linguistic influence. Al-Sayyid Be (ABSL) arose about 70 years ago in a small, insular community with a high incidence of profound prelingual neurodegeneration. In the study of ABSL, we have been able to identify the beginnings of phonology, morphology, syntax, and prosody. The linguistic features of ABSL are not exclusively holistic, nor are they all compositional, but a combination of both. We do not, however, know if these features have been posited as essential even for a proto-language. ABSL has a highly regular syntax as well as a regular morphology, also highly regular but quite distinct from syntax in its patterns. ABSL, however, has no discernible hierarchical structure of the kind observed in more mature sign languages: no spatially organized morphology and no evidence of morphological patterning.
