Abstract:

This study was conducted to determine the average dimensions of the six maxillary anterior teeth in a targeted population and to evaluate the relationships between intertooth and intratooth dimensions. Casts were obtained from 54 patients aged 18 to 35. Measurements of length and width were made on the casts using a digital caliper. Using these measurements, the following ratios were calculated: length to width, width to width, and length to length. Although the tooth dimensions varied somewhat by gender, the ratios were quite consistent. In addition, the golden proportion was not found to correlate with any of the ratios.
