## Abstract

The Blattodea (cockroaches *sensu lato* or roachoids) from the southern coalfields of the UK are reviewed or examined, especially species occurring in more than one coal basin including *Mylacris abrupta* (Bolton, 1930) comb. nov., and undescribed material from Writhlington (Somerset). It is proposed that a derived mylacrid *Mylacris-Sooblatta* assemblage is used to extend the latest Westphalian and earliest Stephanian insect zonation from the continent to southern Britain, thus augmenting the European Pennsylvanian scheme.
