#### Abstract

This paper challenges the view that improving the efficiency of energy use will lead to a reduction in national energy consumption, and hence is an effective policy for reducing national CO<sub>2</sub> emissions. It argues that improving energy efficiency lowers the implicit price of energy and hence make its use more affordable, thus leading to greater use – an effect termed the “rebound” or “takeback” effect. The paper presents the views of economists, as well as green critics of “the gospel of efficiency”. The paper argues that a more effective CO<sub>2</sub> policy is to concentrate on shifting to non-fossil fuels, like renewables, subsidized through a carbon tax. Ultimately what is needed, to limit energy consumption, is energy sufficiency (or conservation) rather than energy efficiency.
