Abstract

Solid-phase microextraction coupled to gas chromatography and mass spectrometry has been applied as a simple alternative method for the analysis of essential oil directly from lavender intact flowering spikes and genuine oils. All recognised major oil constituents were detected by this procedure, with results comparable to those given by a conventional method (organic solvent extraction). Distinctive chromatographic profiles were found for various species.

Keywords

Lavandula angustifolia; Plant materials; Solid-phase microextraction

Keywords

Fragrances; Essential oil
