Abstract

In this report we discuss the consequences of e-health for patient–clinician encounters. On the basis of an analysis of the literature, we propose an analytical framework, composed of five different themes, regarding the impact of e-health on the relationship between patients and their health professionals. Internet health sites can: be or come to be a replacement for face-to-face consultations; supplement existing forms of care; create favorable circumstances for strengthening patient participation; disturb relations; and/or force or demand more intense patient participation. Though there is as yet insufficient empirical evidence supporting these effects, we believe that

yet insufficient empirical evidence supporting these effects, we believe that distinguishing the proposed themes will help to guide an in-depth discussion and further research. We conclude that in particular the redistribution of tasks and responsibilities to patients in their daily lives requires more attention in future research.

Research highlights

° We propose an analytical framework regarding the impact of e-health on the relationship between patients and health professionals. ° We believe that distinguishing the proposed themes will help to guide an in-depth discussion and further research. ° In particular the redistribution of tasks and responsibilities to patients in their daily lives requires more attention in future research.
