## Liver : structure and function.

Author(s) : [POPPER, H.](#) ; [SCHAFFNER, F.](#)

Book : [Liver : structure and function.](#) 1957 pp.xv + 777 pp.

Abstract : This is a splendid book. There will always be differences of opinion and theories among experts: for example, not all pathologists will agree with the analysis and classification of cirrhosis. But leaving aside such disputes, the authors have written a brilliant account of their subject. This is no history book: one will not find an evaluation of the work of the early pioneers. On the other hand one will find a book published as recently as 1956, so that the book is remarkably up to date. The first quarter is devoted to the structure and function of the normal liver. The remaining sections deal with pathologic phenomena in the hepatobiliary system, clinical aspects of hepatic function and structure (a discussion of metabolic, radiological and hi

studies on the living subject), diffuse diseases (including viral and metabolic focal diseases (bacterial and parasitic lesions and tumours). There is a further entitled Internal and external environment and the liver, which discusses the relationship between the liver and other organs and its response to physical stress. This section is a useful appendix in which the authors comment on the coordination of biochemical and histological studies in diagnosing hepatic disease. A bibliography of 735 references up to 1954. An additional section presents precis of subsequent research relevant to each chapter, published in 1955 and 1956. The illustrations are of the printing of high quality.

-L. M. MARKSON.
