ABSTRACT

We investigate the interplay of classical degeneracy and quantum dynamics in a range of periodic frustrated transverse field Ising systems at zero temperature. We find that such dynamics can lead to unusual ordered phases and phase transitions or to a quantum spin liquid (cooperative paramagnetic) phase as in the triangular and kagome lattice antiferromagnets, respectively. For the latter, we further predict passage to a bond-ordered phase followed by a critical phase as the field is tilted. These systems also provide exact realizations of quantum dimer models introduced in studies of high temperature superconductivity.

Announcement

[Information on SCOAP³ and *Physical Review* journals](#)

January 3, 2018

High Energy Physics (HEP) papers published after January 1, 2018 in *Physical Review Letters*, *Physical Review C*, and *Physical Review D* are published open access, paid for centrally by SCOAP³. Library subscriptions will be modified accordingly. This arrangement will initially last for two years, up to the end of 2019.
