Abstract : A group of 65 young adult male white rats of the Wistar strain were fed on purina chow and used as controls while groups of 65 and 63 similar rats

of carrot powder 10, crisco 5, agar 3 and salt 1 per cent., with water to appe weeks a wound 3 cm. in length was made in the abdomen of each rat. Each third group received 150 mg. *dl*-methionine subcutaneously for 10 days, the being given 24 hr. before death. Rats were killed daily during the first to ter postoperative days, heart blood was withdrawn and total protein was estim the tensile strength of the wounds was tested.

The protein-depleted rats showed a prolonged lag in commencement of he proliferation and delay of final healing; in the protein-depleted group which injections of *dl*-methionine the lag was decreased and final healing accelera protein depletion. It is suggested that, with this diet, there was deficiency of sulphhydryl (SH) radical so that it was not readily available and that deficient S activity may be one of the reasons for delayed healing. G. F. Davison.
