Vascular plants of the Pacific Northwest.

Author(s) : [HITCHCOCK, C. L.](#) ; [CRONQUIST, A.](#) ; [OWNBEY, M.](#) ; [THOMPSON, J. W.](#)

Book : [University of Washington Press, Seattle.](#): 1969 pp.914 pp.

Abstract : With the issue of the present part, one of the most notable of the present century reaches completion. The parts have appeared in reverse order of their numeration and have all received due notice in *Plant Breeding Abstracts* [529, XXIX, 3311, XXXII, 2706 and XXXV, 1372]. The present part, dealing with pteridophytes, gymnosperms and monocotyledons, is mainly the work of Cronquist with A. Cronquist covering the vascular cryptogams and Cyperaceae and M. Ownbey covering the genera *Allium* and *Calochortus* of the Liliaceae. The excellent illustrations of the present part are by Mrs. J. R. Janish. The Englerian sequence followed for the dicotyledonous parts is forsaken here in favour of what is believed to be a more natural arrangement.

the monocotyledons devised by Cronquist.

Special points to be noted in the present volume are the glossary of botanical key to the monocotyledonous families based on floral characters compiled in parallel, more general, key to the same families by Hitchcock, a key to aquatic plants (dicotyledons included) based on vegetative characters, also by Hitchcock keys for the grasses, a key to species based exclusively on vegetative characters, a general key to genera, again by Hitchcock.

This volume includes two groups of the greatest economic importance, the particular species of *Abies*, *Larix*, *Picea*, *Pinus* and *Pseudo-tsuga*, and the grasses, the extensive notes on range of variation and intergradation between them deserving of close attention. In the grasses, *Agropyron*, *Elymus*, *Sitanion* are retained as separate genera, but the information provided on their intergradation justifies the misgivings expressed at the propriety of so doing. This part closes with addenda and corrections to the whole work and a complete index to the
