ABSTRACT

Objective

To examine the test-retest reliability of the *DSM-IV* anxiety symptoms and disorders in children with the Anxiety Disorders Interview Schedule for *DSM-IV*: Child and Parent Versions (ADIS for *DSM-IV*: C/P).

Method

Sixty-two children (aged 7–16 years) and their parents underwent two administrations

sixty-two children (aged 7 to 10 years) and their parents underwent two administrations of the ADIS for *DSM-IV: C/P* with a test-retest interval of 7 to 14 days.

Results and Conclusions

Results revealed that the ADIS for *DSM-IV: C/P* is a reliable instrument for deriving *DSM-IV* anxiety disorder symptoms and diagnoses in children. The ADIS for *DSM-IV: C/P* was found to have excellent reliability in symptom scale scores for separation anxiety disorder, social phobia, specific phobia, and generalized anxiety disorder and good to excellent reliability for deriving combined diagnoses of these disorders, as well as using child-only and parent-only interview information. Reliability coefficients were generally similar and, in most instances, superior to those found in previous ADIS-C/P reliability studies. Limitations and directions for future research are discussed.
