 [Twenty years of seed research.](#)Author(s) : [BARTON, L. V.](#) ; [CROCKER, W.](#)Book : [Twenty years of seed research.](#) 1948 pp.148 pp.

Abstract : The purpose of this book is to place before a wider public the (re)prolonged period of research on seeds, completed or still in progress at the Thompson Institute for Plant Research, Yonkers, New York.

The period under review covers 20 years. Much, if not all, of the material has been brought to the light in amplified form in scientific journals or is common knowledge, and to a research worker who keeps abreast of his literature may not be over-enthusiastic. But to commercial growers, seedsmen and others to whom such information has been largely inaccessible the results set out should prove interesting and useful. The book is in two parts, the first being concerned with germination problems.

with storage and the life span of seeds. The chapter on weed seed germination shows how necessary to the control of a difficult weed is a thorough understanding of its characteristics and behaviour of its seed. That stratification and low temperature prerequisites for the germination of many seeds, e.g. the *Rosaceae*, is well known to growers, but to them the chapter providing definite data on the length of the stratification period and the optimum temperatures for a number of selected species will be most useful. Coming now to a discussion on internal breaking pressures an ingenious test has been described whereby the internal breaking pressure of the black walnut (*Juglans nigra*) was revealed as no less than 627 pounds. How this resistance is overcome in nature is a problem still to be determined. Rapid viability tests of slow germinating seeds by excising embryos and the changes indicating viability or the reverse are well known for a few species. Extensive experiments on the efficacy of some so-called "growth-substances" have shown that far from hastening germination they are likely to inhibit it. In Part II the most useful chapters are those on factors affecting the keeping quality of seeds and on the storing of vegetable seeds. The references are clustered at the foot of each chapter and the brevity of the chapters themselves show the extreme difficulty of compressing into so small a space such a vast amount of useful information. This difficulty has not been entirely overcome. G.St.C.F.

Language of summary : English

Indexing terms for this abstract:

Organism descriptor(s) : Juglans, Juglans nigra, plants, Rosaceae

Descriptor(s) : cold, control, effects, embryos, germination, keeping quality, literature, germination, seed quality, seeds, stratification, temperature, vegetables, walnuts

Identifier(s) : black walnut, seed stratification, United States of America, vegetables

Geographical Location(s) : New York, USA

Broader term(s) : Juglandaceae, Fagales, eudicots, angiosperms, Spermatophyta, eukaryotes, Juglans, Rosales, Middle Atlantic States of USA, Northeastern States of USA, APEC countries, Developed Countries, North America, America, OECD Countries
